

Huge images in Camera RAW, TIFF, JPEG2000, PSD, BMP and other formats are now cached as JPEG previews and can be viewed at the same speed as regular JPEG images. This is especially noticeable when images are very large (more than 300 MB) or located on networks with lower bandwidth connections.

This option is turned on by default, previewing of large images will be much faster and it will also reduce the CPU load of the Server PC.

- Which media formats does this option work for?

It works with all formats except JPG

- Where will my previews be stored?

In the “preview” sub-folder of the folder that was selected to store the thumbnails from your server catalog. This can be checked or configured via the Dominion Server Administration panel individually for each catalog.
